

## ABSTRACT

An object of the present invention is to provide an aromatic polycarbonate resin composition having good rigidity and good hydrolysis resistance.

The present invention is an aromatic polycarbonate resin composition comprising:

- (A) 100 parts by weight of aromatic polycarbonate (component A)
- (B) 0.1 to 20 parts by weight of layer silicate (component B) having 50 to 200 milliequivalents/100 g of cation exchange capacity and ion-exchanged by an organic onium ion represented by the following general formula (I):

- (wherein M represents a nitrogen atom or a phosphorus atom,  $R^1$  and  $R^2$  represent an alkyl group having 6 to 16 carbon atoms and may be the same as or different from each other, and  $R^3$  and  $R^4$  represent an alkyl group having 1 to 4 carbon atoms and may be the same as or different from each other),
- (C) 0.1 to 50 parts by weight of compound (component C) having an affinity for the component A and having a hydrophilic component, and
- (D) 0.005 to 1 part by weight of ester (component D) of a higher fatty acid and a polyhydric alcohol.
